MAGAPAL® PALLET MAGAZINE FOR STACKING & DESTACKING

Increase productivity **while limiting accidents and RSI** linked to manual pallet handling by operators.

Fonction :	Empileur ou Dépileur ou Mixte 21 secondes
Temps de cycle :	
Capacité :	De 15 à 30 palettes/pile

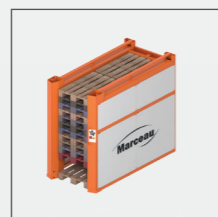

Designed for stacking and destacking pallets, the pallet magazine enables a pallet to be **removed from or added** to a stack without the operator having to manually handle the pallet.

The pallet destacker automatically distributes and distributes pallets in packaging, order-picking or shipping areas. A stack of pallets is loaded into the device using a pallet truck or forklift, and then each pallet is made available for retrieval by the forklift or pallet truck.

The pallet stacker is ideal for storing pallets in receiving areas, once the products have been removed. The empty pallet is inserted into the pallet magazine by means of a forklift or pallet truck, and the device builds up a straight, uniform stack of pallets which can then be removed by means of a pallet truck or forklift.
